PRODUCT & USER GUIDE · V1.0 · SEPTEMBER 2026

Take back control of every **subscription** you pay for.

Subscrr is a subscription-tracking platform that shows individuals and teams what they **really** spend on recurring services — in one dashboard, in any currency — and warns them **before** the next charge happens. This guide covers every feature, how the product differs from alternatives, and how the content platform is operated.

Includes: full feature walkthrough · AI receipt scanning · notification system ·
Payload CMS blog administration · platform comparison · technical architecture

What Subscrr does

Banks show you money **after** it leaves. Subscrr shows you **before** — that one-day-early warning is the entire value proposition.

1

Track everything recurring

Every subscription in one ledger: price, currency, billing cycle, category, payment method, renewal date. Add manually, paste billing text, or scan a receipt with AI.

2

See the honest numbers

Yearly plans are normalised to monthly equivalents, mixed currencies are converted to one display currency, and the true 12-month commitment is always visible.

3

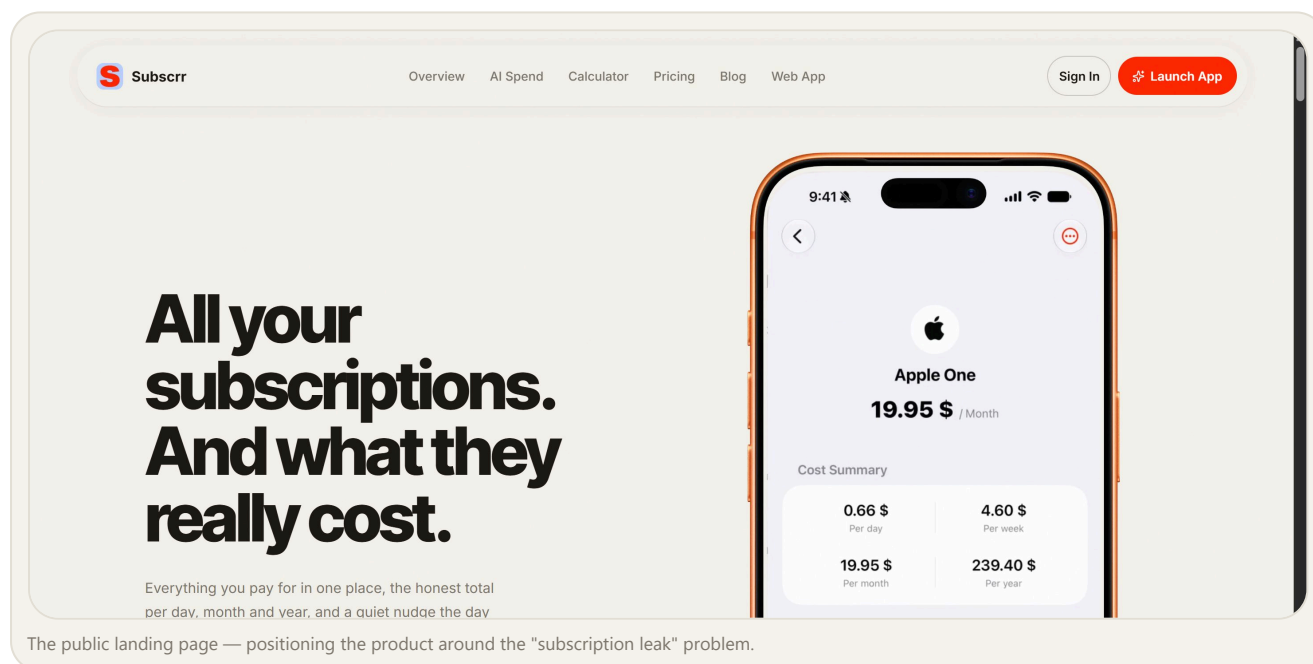

Never be surprised

A background engine generates renewal, trial-end and budget alerts, delivered as in-app notifications and real email — days before money leaves.

4

Analyse & optimise

Category breakdowns, 12-month spend projections, top-expense ranking and an interactive "subscription leak" calculator quantify the waste you can cancel.

From sign-up to savings in four steps

1

Create an account

Email + password with industry-standard security (hashed credentials, rate-limited login, brute-force lockout). A password-reset flow sends a real, single-use email link valid for one hour.

2

Add subscriptions — three ways

Manual entry with brand colours & icons · paste any confirmation email or bank line for parsing · or drop a receipt/invoice image into the AI Scanner.

3

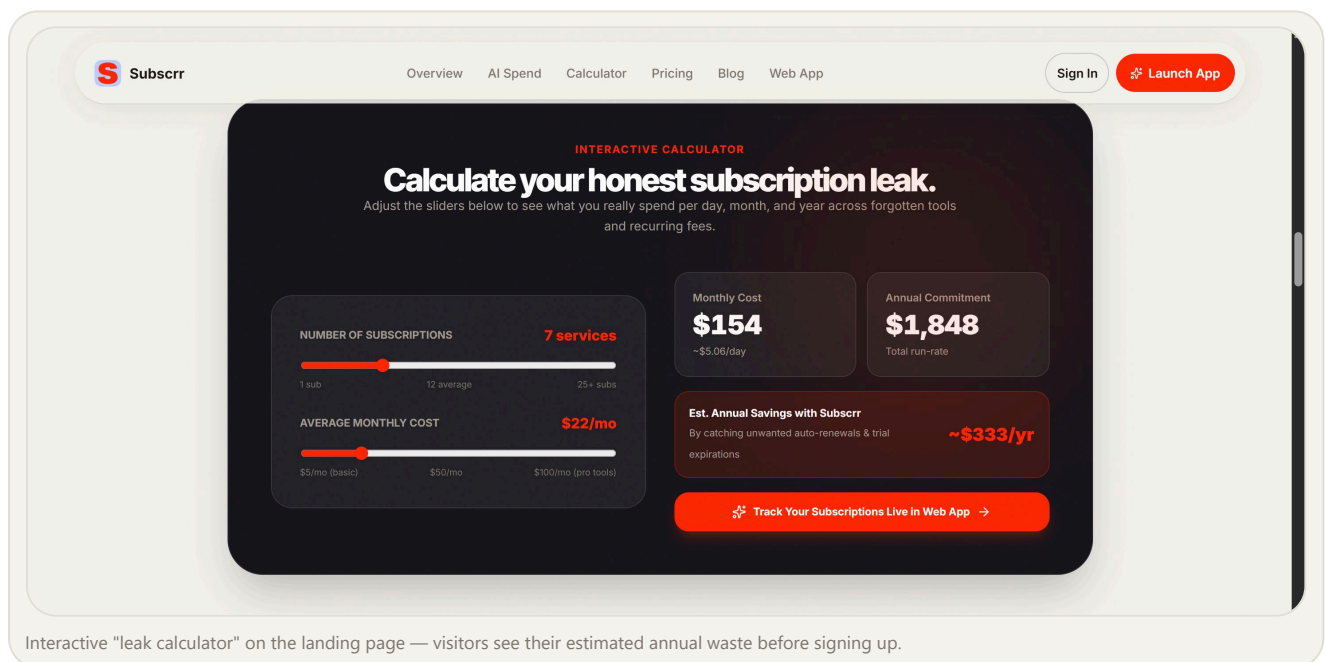

Watch the dashboard normalise reality

Monthly spend, annual commitment, daily burn, next charge — recalculated live, in your currency, across USD/EUR/GBP/INR/JPY/CAD/AUD.

4

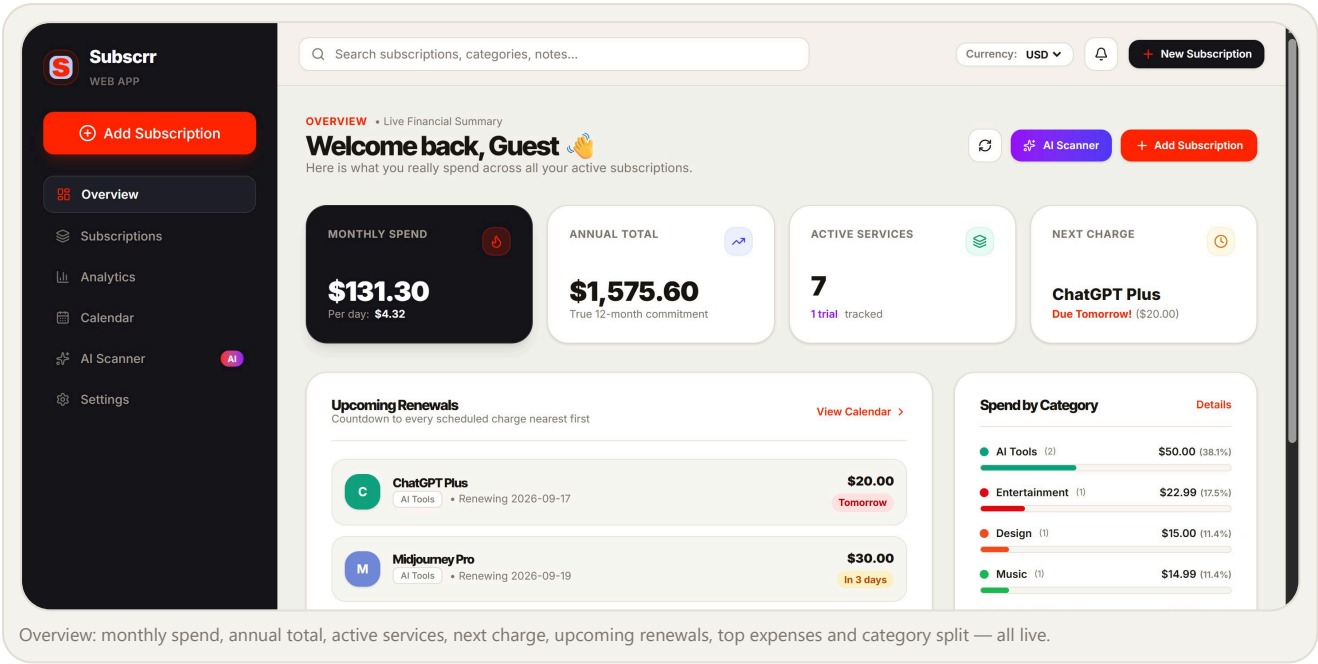

Act on alerts before they cost you

Renewal countdowns, trial-ending warnings and budget-threshold alerts arrive in-app and by email — so cancelling is a decision, not a discovery.

Interactive "leak calculator" on the landing page — visitors see their estimated annual waste before signing up.

The dashboard — your financial summary

Everything is normalised

A \$100/year GitHub plan shows as its true monthly equivalent next to monthly bills, so the totals are honest.

Multi-currency by design

Track in USD, spend in INR — amounts convert to your display currency using live rates, per-subscription.

AI SPEND ENGINE • Vision-powered receipt & statement parser

AI Receipt Scanner

Drop in a real receipt, invoice screenshot, or paste billing text — the AI reads the merchant, price, cycle and next renewal date. No demo data, ever.

Scan Image

Paste Text

Drag a receipt here, or click to browse

Invoice screenshots, billing emails as images, receipt photos — PNG · JPG · WebP · PDF, up to 10 MB

Scan with AI

Extraction Result

Review before adding — every field is what the AI read, not a guess from us.

Nothing scanned yet

Your extracted subscription will appear here — structured and ready to save.

AI Receipt Scanner — drop a real invoice image or paste billing text; a vision model extracts merchant, actual amount, cycle, renewal date and brand colour. No demo data: undeterminable fields are flagged, never invented.

Payload CMS — the built-in blog engine

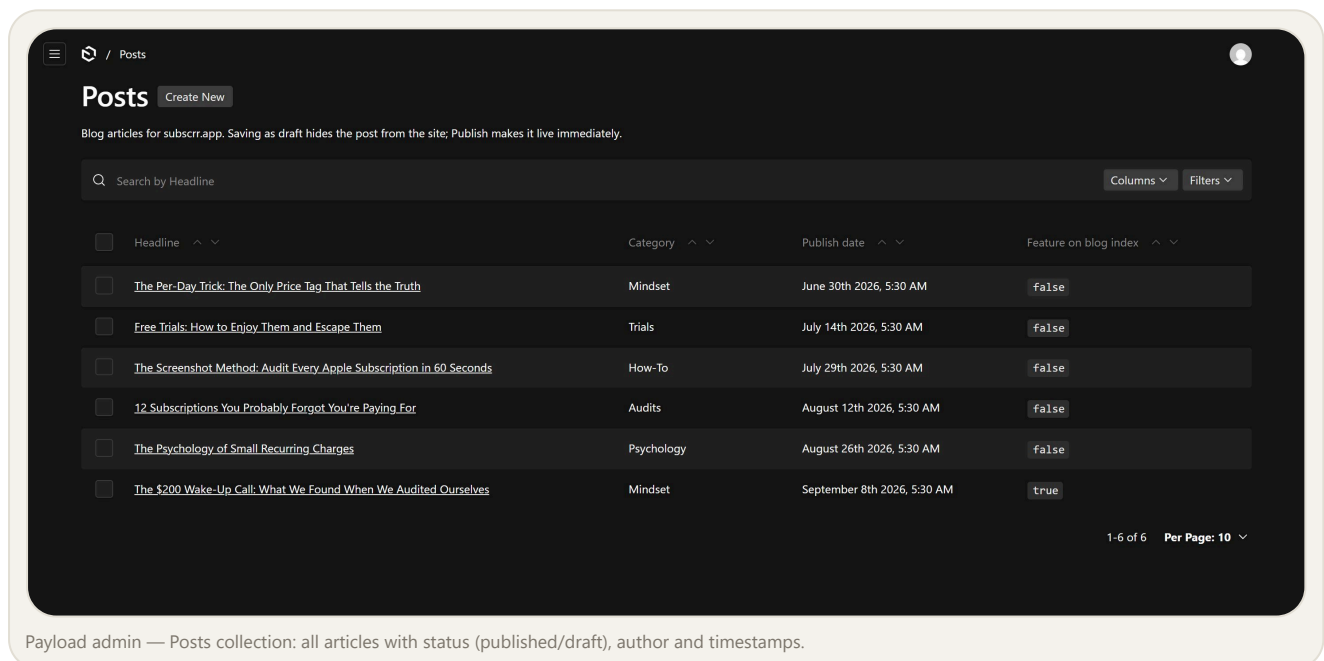

The marketing blog runs on **Payload CMS 3**, embedded directly inside the Next.js application — a database-backed, admin-editable content system with draft workflow and version history. No code deploys needed to publish an article.

Where it is & how to log in:

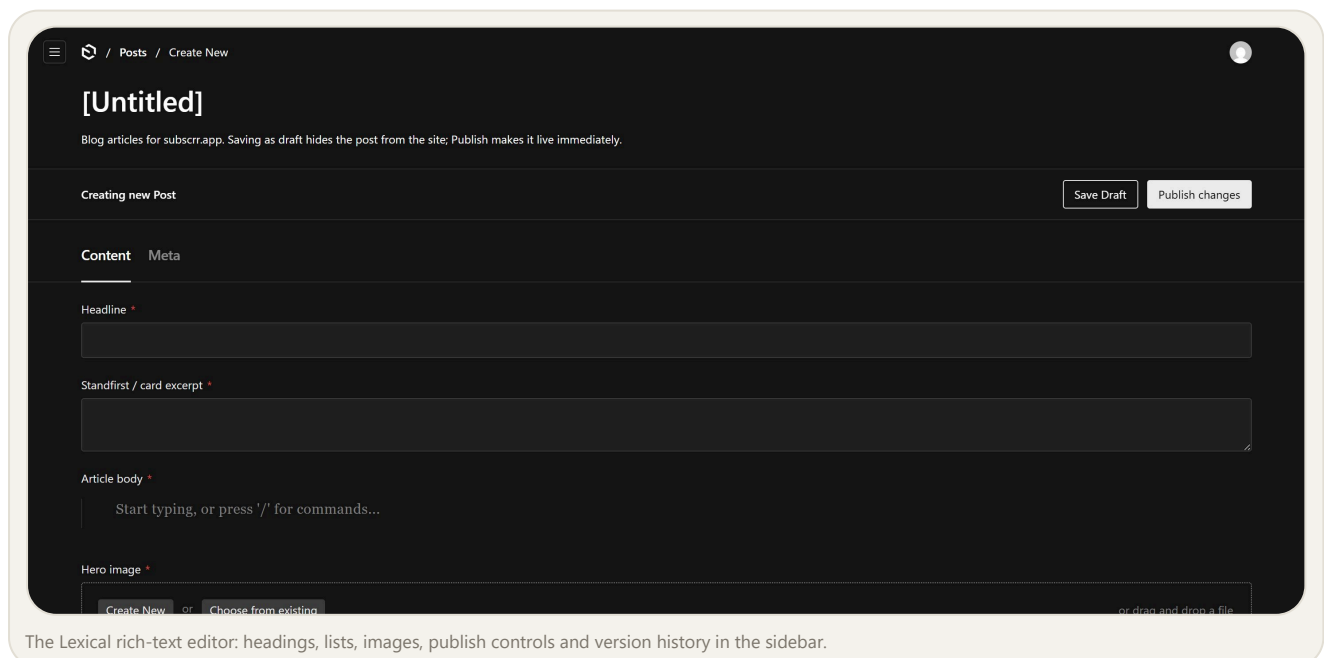

Admin panel URL: `/admin` (e.g. `http://localhost:3000/admin`)

CMS admin account (separate from app users): `admin@subscrr.local` / `ChangeMe-Payload-2026!` — change via `PAYLOAD_ADMIN_EMAIL` / `PAYLOAD_ADMIN_PASSWORD` env vars before re-seeding.

Workflow: edit a post → *Publish changes* → live on `/blog` within ~60 seconds. *Save Draft* hides it from the public site. Every change is versioned (20 versions per document).

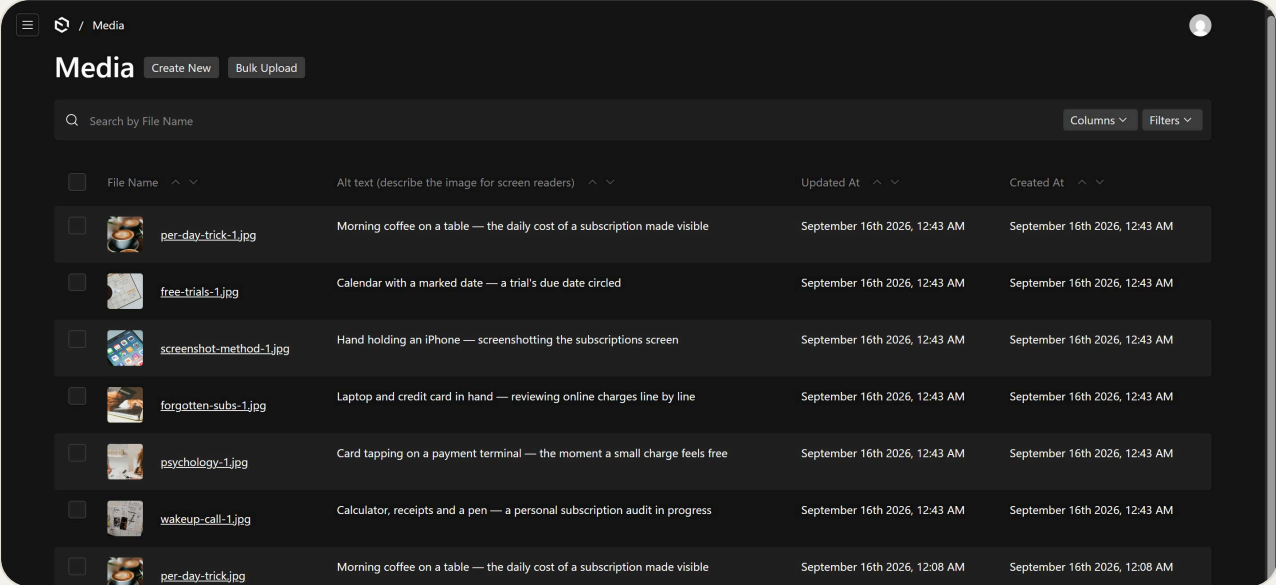

Payload admin — Posts collection: all articles with status (published/draft), author and timestamps.

The Lexical rich-text editor: headings, lists, images, publish controls and version history in the sidebar.

Media library & admin roles

The screenshot shows a 'Media' library interface. At the top, there's a search bar labeled 'Search by File Name' and buttons for 'Create New' and 'Bulk Upload'. Below the search bar is a table with columns: 'File Name', 'Alt text (describe the image for screen readers)', 'Updated At', and 'Created At'. The table contains several rows of image assets, each with a checkbox, a small image thumbnail, a file name, an alt text description, and timestamps for when it was updated and created. The alt text descriptions are: 'Morning coffee on a table — the daily cost of a subscription made visible', 'Calendar with a marked date — a trial's due date circled', 'Hand holding an iPhone — screenshotting the subscriptions screen', 'Laptop and credit card in hand — reviewing online charges line by line', 'Card tapping on a payment terminal — the moment a small charge feels free', and 'Calculator, receipts and a pen — a personal subscription audit in progress'.

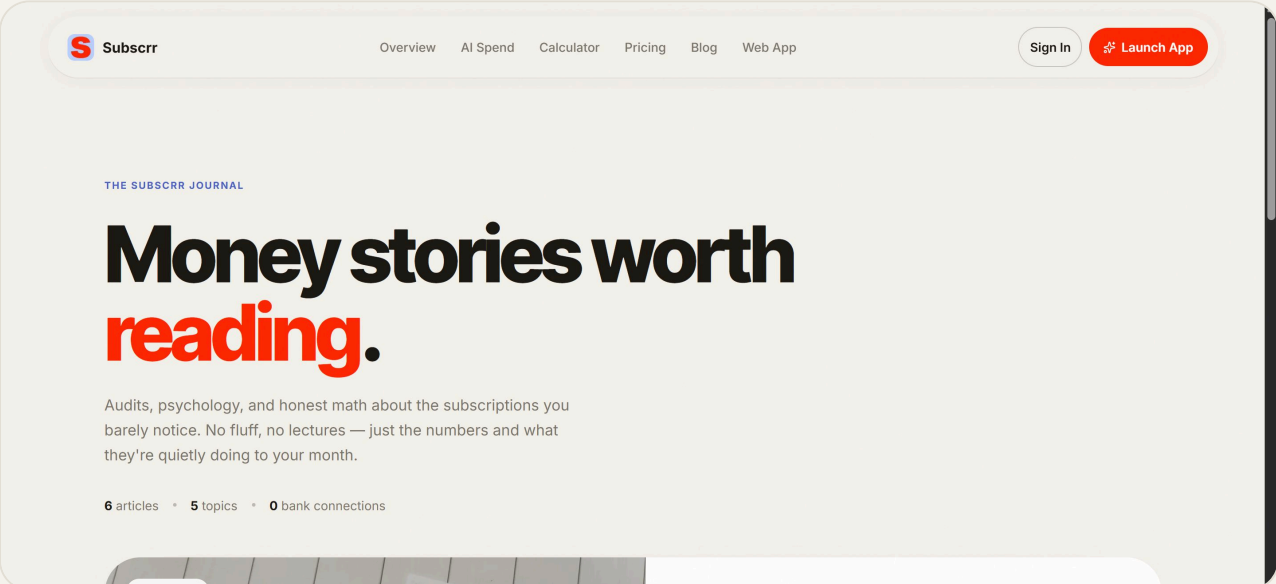

Media collection: uploaded images with required alt text; responsive size variants generated automatically and served through the app's image pipeline.

Three collections

Posts (title, excerpt, rich body, hero image, slug, category, tags, publish date), **Media** (image assets), **Blog Authors** (CMS logins — deliberately separate from application accounts).

Why embedded CMS matters

One deploy, one domain, one auth boundary for app + content; REST & GraphQL APIs namespaced under `/api/payload` so they never collide with the product API.

The screenshot shows the 'Subscrr' public blog interface. The header includes the 'Subscrr' logo, navigation links for 'Overview', 'AI Spend', 'Calculator', 'Pricing', 'Blog', and 'Web App', and buttons for 'Sign In' and 'Launch App'. The main content area features a large heading 'THE SUBSCRR JOURNAL' followed by the article title 'Money stories worth reading.' in a large, bold font. Below the title is a short paragraph: 'Audits, psychology, and honest math about the subscriptions you barely notice. No fluff, no lectures — just the numbers and what they're quietly doing to your month.' At the bottom of the article preview, it says '6 articles • 5 topics • 0 bank connections'.

The public blog rendered from the CMS — SEO metadata, JSON-LD structured data and ISR revalidation included.

How Subscrr compares

The subscription-tracking space splits into manual ledger apps and bank-aggregation tools. Subscrr takes a third path: manual + AI-assisted tracking with a privacy-first, multi-currency core.

	SUBSCRR	BANK-AGGREGATION APPS (Rocket Money, Copilot)	MANUAL LEDGER APPS (Bobby, Notion trackers)
Works without bank credentials	Yes — nothing to connect	No — requires read access to accounts	Yes
AI receipt / invoice extraction	Yes — vision model, real amounts	No (transaction matching only)	No
Proactive renewal & trial alerts by email	Yes — before the charge	Partial	Rarely / manual
True multi-currency with conversion	Yes — per-subscription	Limited to bank locale	Usually static
Built-in CMS blog for the brand	Yes — Payload, embedded	No	No
Self-hostable / data ownership	Yes — SQLite files, containerised	No — cloud only	Varies
Cross-platform web + iOS/watch positioning	Yes	Yes	Mobile-only often

The differentiator in one line: Subscrr delivers the foresight of bank-aggregation tools without asking for bank access — using AI extraction on receipts instead — and packages a complete content platform for the brand in the same deploy.

Technical architecture

Stack

Next.js 16 (React 19) frontend · Express API with Helmet, CORS allow-listing and four scoped rate limiters · SQLite with integer-cent money math and versioned migrations · Payload 3 CMS · Nodemailer/Resend email · Docker + GitHub Actions CI.

Security posture

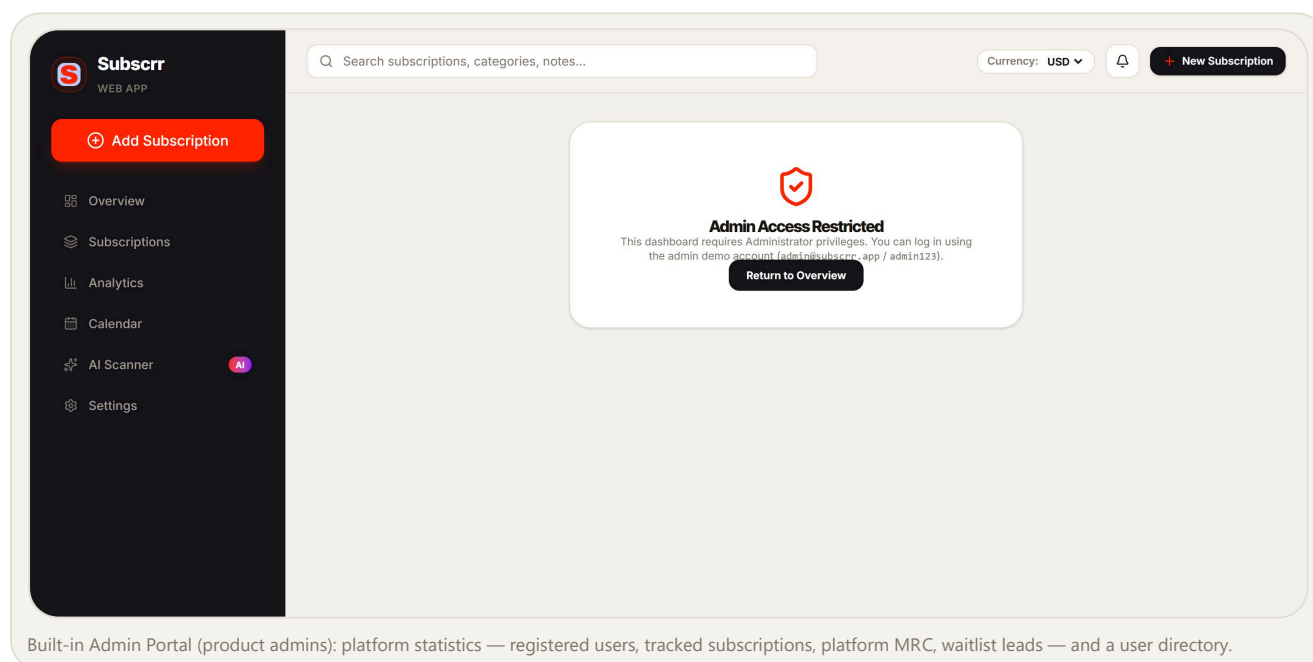

JWT auth with pinned algorithm · per-account login logout · hashed single-use reset tokens · authenticated private file serving · CSV formula-injection sanitisation · secrets fail-safe boot checks.

Data model

Users, subscriptions (cents-stored amounts, cycle normalisation), notifications, activity logs, waitlist leads — plus a separate content database for the CMS. Full CSV/JSON export keeps data portable.

Operations

Health endpoint with live DB verification · daily alert cron · structured activity logging · persistent volumes · one-command seed for demo environments.

Subscrr

Know what you pay. Before you pay it.

Quick reference

App sign-in: `/login` · CMS admin: `/admin` · API health: `/api/health`

Data export: Subscriptions → Export CSV/JSON
